Case Study

Dust Collectors That Accommodate Your Needs

Product: Gold Series
Size: GS96
Application: Wood
Customer: Cabinetec - St. George, UT.
Representative: Swaim and Associates

Challenge

Cabinetec is a manufacturer of quality framed and frameless box cabinetry. This large operation produces cabinetry in ten different wood species, which was also producing a substantial amount of wood dust in the air. Cabinetec had a limited amount of area in which to place a dust collection system that would handle their operation.

Solution

Mark Swaim of Swaim and Associates went in and looked at the area, in which he placed a GS96 collector for the customer. This was all done without the time and costs of demolition to place a collector on site, as quoted by competitors. This GS96 had the capabilities of handling the 60,000 CFM @ 18" s.p and an air to cloth ratio of 1.92:1. The collector size accommodated the customer's needs and now keeps their location free of the wood dust, while keeping the customer running efficiently.

GS96 wood application at Cabinetec in St. George, UT.
